

Closing the Wishlist Confidence Gap

Improving Wishlist-to-Purchase Conversion on Myntra - without discounts

Product Manager, Growth Team

2/10 Re-engagement is not the bottleneck - decision confidence is the lever that moves WPCR

North star (WPCR): % of users who purchase ≥ 1 wishlisted item within 30 days of adding it.

1. Re-engagement: % of wishlisted items revisited in 30 days. NOT the bottleneck (segment already shops 2-4x/month).
2. Decision confidence (PRIMARY LEVER): % of revisited items where fit / quality / comparison / occasion doubt is resolved.
3. Cart conversion: % of resolved items added to cart.
4. Checkout: % of those cart items purchased.

Segmentation: bookmarkers vs genuine intenders; ethnic/occasion (higher AOV, high uncertainty) vs basics; price-waiters OUT OF SCOPE vs confidence-blocked IN SCOPE.

Callout: wishlisted demand dies at stage 2. If doubt is not resolved in-app, cart and checkout never get a fair shot.

3/10 AI discovery: quality is the loudest complaint; fit is real; price exists but is out of scope

Workflow: Play Store + App Store + YouTube (n=550 tagged reviews) -> LLM cluster -> tag -> mention share.
Reviews under-index silent wishlist freeze; primary research fills that gap.

Quality / authenticity (fabric, finish): 47.8% IN SCOPE

Price change / deal-waiting: 13.9% OUT OF SCOPE

Fit / size uncertainty: 13.0% IN SCOPE

Found an alternative (comparison): 5.2% IN SCOPE

Occasion mismatch: 2.6% IN SCOPE

Also tagged: comparison 11.8%; external research 10.5% of corpus.

Paste the public Discovery Engine URL into the deck LINKS before you submit.

4/10 Pilot (n=10): "Probably" buyers leave the app to decide - no in-app way to resolve doubt

Google Form, one named item each. Designed segment: 24-30, Tier 1-2, 2-4x/month, 5+ wishlist, dormant 2+ weeks. Named items: 4/10 ethnic/occasion (Rakhi dress, wedding dress, kurta set, kurta).

Main blocker: price/budget 3/10 (out of scope); comparison 2; quality 2; occasion/style 2; fit 1. Confidence cluster = 7/10. Intent: Probably 6/10 (target zone); Yes definitely 3; Not sure 1.

Outside the app: 10/10 did at least one. Compare prices 6/10, store 6/10, Instagram 3, friends 3, YouTube/Google 3. 7/10 wanted similar-buyer reviews/photos. Coping: order two and keep the fit; size-chart then exchange; leave until payday.

Caveat: directional, not powered. Screener leaky (Q2/Q3 blank for 7/10); one Rarely shopper included. Pursue 7/10 confidence, not 3/10 price-waiters.

5/10 The gap is in-app confidence at reconsideration - not lack of desire to buy

Segment: 24-30, Tier 1-2, 2-4x/month, impulsive savers, 5+ items sitting 2+ weeks, Probably intent, ethnic/occasion and fashion-forward (not basics).

Product outcome: Decision Confidence Rate (funnel stage 2).

Root cause: after impulsive save, no in-app way at revisit to resolve fit, quality/authenticity (fabric, threadwork vs photo), comparison, or occasion-fit. Users leave; most never complete the loop.

Workarounds: extra sizes + returns; friends; stores; off-app reviews; infinite wishlist.

User value: less anxiety, fewer returns, faster yes/no on high-stakes occasion buys.

Business value: ethnic AOV > basics, so a modest lift moves GMV from demand already saved - no discount, no acquisition. Guardrail: false confidence must not raise returns.

Thinking: WPCR -> stage-2 outcome -> AI discovery (quality+fit; price excluded) -> research (ethnic, Probably, leave-app) -> in-app confidence gap.

6/10 Ethnic-wear decision confidence is the lever that fits the data and the no-discount constraint

Largest allowed blocker: pilot 7/10 confidence vs 3/10 price. Discovery: quality 47.8% + fit 13%.
Ethnic/forward is less safe than basics (fit + threadwork/fabric vs photo).

No margin giveaway. Instrumentable stage-2 metric. Data already exists (reviews, return reasons, size charts).

Not basics (lower AOV, lower uncertainty). Not price (forbidden). Not bookmarking (no purchase intent).

7/10 MVP: an AI layer inside the wishlist that answers fit, quality, and comparison without leaving the app

Fit & Confidence Assistant sits on the existing wishlist - not a new destination.

1. Confidence score from reviews/return reasons, with provenance (never a fake absolute).
2. Ask-a-question on the saved SKU: fit, fabric/threadwork vs photo, occasion.
3. Personalized fit from past order/fit feedback when available.
4. Comparison assist for at most 2-3 similar wishlisted items.

Mock: saved kurta set, 3 weeks, intent Probably -> labelled confidence + occasion question grounded in reviews.

Paste the public MVP URL into LINKS before submit.

8/10 WPCR is the north star; we watch whether doubt is resolved - and that we do not inflate returns

North star: WPCR (30-day wishlist-to-purchase).

Leading / adoption: % of in-scope wishlist visits that use the assistant.

Leading / resolution: % of uses ending in add-to-cart or this-helped / explicit decide-not-to-buy.

Guardrail: return rate must not increase.

Guardrail: wishlist add rate must not drop.

Guardrail: fit/quality support contacts expected to fall.

9/10 We de-risk cold start, hallucination, trust, hiding, and comparison overload before scale

Cold start: brand size charts + community Q&A; say insufficient evidence; no invented score.

Hallucination: ground in review/return text; provenance; caveats not absolute claims.

Low trust: real reviews beside the summary, labelled as synthesis.

Discoverability: embed in the wishlist row at hesitation, not a separate hub.

Comparison fatigue: cap at top 2-3 similar saved items.

10/10 Resolve fit, quality, and comparison doubt at hesitation to lift ethnic-wear WPCR without touching price

By resolving fit, quality (including online vs real fabric/threadwork), and comparison at hesitation on high-AOV ethnic/fashion-forward wishlist items - validated by discovery (quality+fit) and the n=10 pilot (7/10 confidence, 6/10 Probably, 10/10 leave-app) - we lift decision-confidence rate and thus WPCR, without touching price.
